Fyi. John Cima not concerned yet. The sandbags are causing water to pond in A pond. Before water just flowed out the eroded area. However, the flow under the rip rap will be a concern if it gets worse. We are to hear more next week.

Keep you informed.

Jeff

John Cima came out, he's not overly concerned, with the rip-rap and bags in place the 'A' pond is holding water, however, the flow under the rip-rap is a concern should it start to increase in flow rate.

From a legal/environmental standpoint it is a concern, will receive some guidance next week

John Cima is going out to Possum tomorrow. He will take a look at the area A sand bags.

Attached.

Discharge (seeping) at C Pond, decreasing from previous inspection. Standing water around weir.

Standing water behind sand-bags at 'A' with seeping flow under bags in the entire area. The flow is audible and appears to be coming from under the rip-rap, similar to a "babbling brook". In addition, the southern edge of the 'A' pond interior, from the SE corner to the sandbags, is holding water, something that was not seen last year.

No recent precipitation. Last storm event was 03/26-03/27 and produced roughly 0.7" of rain.

Let me know if you have any questions.
